Annex

Trade the outcome of anything.

Permissionless binary prediction markets on Mezo. Anyone can create a yes/no market, trade YES or NO against an on-chain constant-product AMM, and redeem winning shares 1:1 for MUSD.

THE PROBLEM

People already bet on outcomes. The venues do not fit.

Offshore and custodial

Funds sit with an operator, not in a contract you can verify.

Hard to reach

A Bitcoin-native user needs a separate chain, a bridge, and a stablecoin they do not hold.

Opaque

A proprietary order book and a private risk engine. You cannot check that a market is solvent.

No Bitcoin rails

Bitcoin has the money, the users and the finality — and no venue for collective opinion.

Annex

THE SOLUTION

A prediction market protocol that runs natively on Mezo.

- **Any wallet** can create a yes/no market in one transaction.
- An **on-chain constant-product AMM** prices the two sides and settles every trade.
- The winner redeems **1:1 for MUSD**, a Bitcoin-backed stablecoin.
- Everything is verifiable on-chain: **no operator, no order book, no off-chain component**.

MARKETS LIVE	POOL	CONTRACT	TESTS
7	2.6K MUSD	1	51

Annex

HOW THE AMM WORKS

The quote is the price you pay.

```
buy YES with a MUSD
  └─► split a into a complete set: a YES + a NO
    ├─ the NO half becomes counter-collateral
    └─ the pool releases YES (k preserved)

buyer receives  a + swapOut YES shares
priceYes = reserveNo / (reserveYes + reserveNo)
```

- **Exact solvency** — every MUSD deposited mints exactly one YES and one NO.
- **Honest pricing** — the marginal cost is the quoted cost, plus ordinary slippage.
- **The spread is the business** — the liquidity provider earns it, openly.

LIVE ON MARKET #0

25 MUSD → 41.67 YES

Average execution 60.00¢ · price impact 3.32%

Annex

WHY IT IS SAFE

The invariant is the product.

```
totalCollateral  ==  totalYes  ==  totalNo
```

No admin path

No withdrawal function, no upgrade key, no admin pricing, no oracle.

Permissioned resolution

Only the market's resolver or the protocol owner can settle it.

Proven by tests

51 Foundry tests: unit, fuzz, reentrancy, full lifecycle, invariants.

You do not have to trust an operator's risk engine — you read it off the contract.

THE DEMO — 90 SECONDS

Connect. Trade. Resolve. Redeem.

01

Connect

A Bitcoin wallet (Unisat, Xverse, OKX) or any injected EVM wallet.

02

Create

Question, resolution criteria, close date, 1,000 MUSD of liquidity. You become the LP.

03

Trade

Buy 25 MUSD of YES at a live quote. The pool price moves immediately.

04

Settle

The resolver posts the outcome; winning shares redeem 1:1 in MUSD.

No registration, no deposit address, no support ticket.

ROADMAP

Bitcoin-native markets for every measurable claim.

WAVE 1

More liquidity

Transferable LP shares so anyone can provide liquidity, plus a price-history chart per market.

WAVE 2

More outcomes

Multi-outcome markets beyond yes/no, and optional oracle resolution a creator can point at.

BEYOND

Settlement that asks nobody

A venue for collective opinion on Bitcoin rails, with settlement you can read off the bytecode.
